03-05 Transparency of Perspective

In BrainFrame, truth is rarely absolute. But perspective is always present.

Rather than pretending to be neutral, BrainFrame operates from a core value: **transparency of perspective is more useful than the illusion of objectivity**.

Why It Matters

- Every system embeds assumptions — about humans, value, growth, success.

- AI responses are shaped by framing, tone, and philosophical defaults.

- Users deserve to know the lens they're looking through.

What It Looks Like

- BrainFrame modules clearly express their underlying purpose and design logic.

- Prompts disclose their intended tone and frame (e.g. challenge, comfort, clarity).

- System behaviours adapt based on user-aligned values (e.g. curiosity, impact, integrity).

Benefits

- Builds trust with the user.

- Enables meaningful disagreement or refinement.

- Avoids manipulation or unintentional bias reinforcement.

- Allows users to shape the lens — not be shaped by it invisibly.

Example: Prompt Clarity

Instead of: "List 5 things you're grateful for."
BrainFrame says: "Gentle prompt for emotional grounding. Would you like to explore gratitude or shift focus elsewhere?"

Transparency doesn't mean oversharing. It means owning the frame — so users can choose their own.

In BrainFrame, perspective isn't hidden. **It's part of the dialogue.**
